

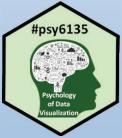

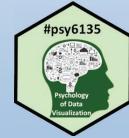

Graphical Perception

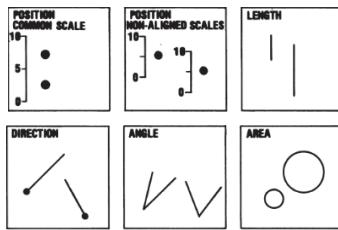

Michael Friendly
Psych 6135

<https://friendly.github.io/6135>

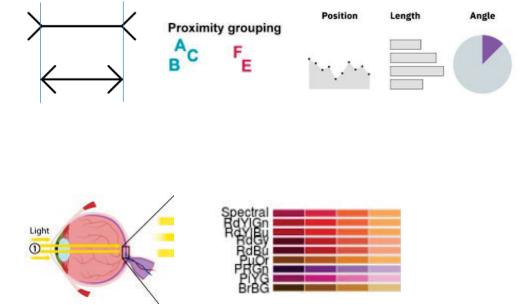

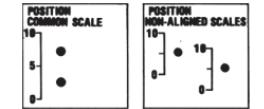

Graphical Perception

- In constructing a graph, **quantitative** and **categorical** information is **encoded** by visual attributes:
 - Length
 - Position along axis
 - Angle
 - Area
 - Color, shape, line style
- What determines the ability of graph viewers to:
 - Make **comparisons** (which is larger?)
 - Estimate a magnitude?
 - See **patterns**, trends, unusual features?

Topics

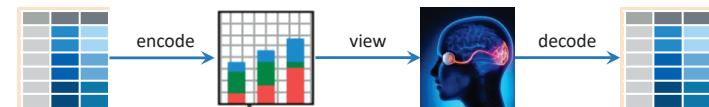

- Perception & Cognition
 - Encoding, decoding
 - Top-down vs. bottom-up processing
- Perceptual aspects
 - Illusions
 - Gestalt factors
 - Accuracy of decoding
- Cognitive aspects
 - Memory
 - Color

2

Encoding & decoding

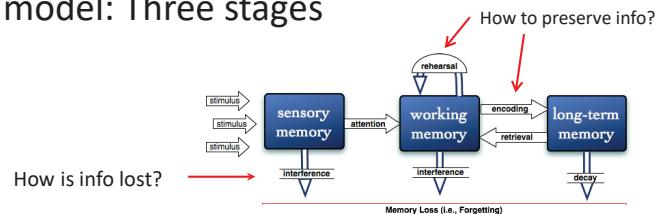

- When we construct a graph, we **encode** a numerical or categorical variable as a graphical attribute
- When we view a graph, the goal is to **decode** the graphical attributes and extract information about the data that was encoded

- Encoding should rely on features that can easily be decoded
- Designing effective graphs depends on understanding these ideas!

Visual & cognitive systems

- A simplified model: Three stages

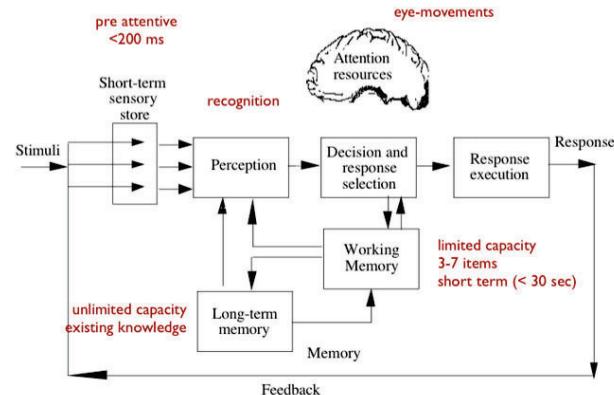

- Sensory (iconic) memory
 - pre-attentive, automatic, feature detection
 - massively parallel, short duration, easily fooled ("thinking fast")
- Working memory
 - requires attention, limited capacity (~ 4-6 "chunks")
 - memory aids: rehearsal; imagery
- Long-term memory
 - real-world knowledge, ~ unlimited capacity, inference ("thinking slow")

5

Perception vs. cognition

Another coarse distinction:

- Perception:** Processing of the signals coming in: what you **"see"**
- Cognition:** How you **understand** and **interpret** what you see

A nice scientific or textbook diagram

But where is cognition?

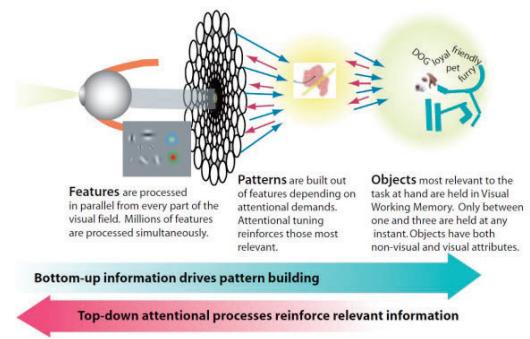

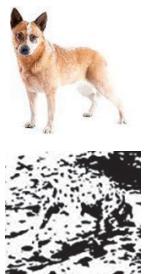

Based on slide from G. Grinstein

6

Perception: Bottom-up & Top-down

- Bottom-up processing
 - Low level: features → pattern → object
 - Detect edges, contours, color, motion
- Top-down processing
 - Driven by goals, expectations
 - Uses prior knowledge, experience, filters what we "see"

7

Perception: Bottom-up

How many 5s in this display?

1561321203658413076510374627
4173127527327592732990709742
1703707774179527931749270973
4019743217909370945179279417

How many 5s in this display?

1561321203658413076510374627
4173127527327592732990709742
1703707774179527931749270973
4019743217909370945179279417

Numerals differ only in **shape**, and are high-level symbols

You have to literally scan them **all** & count the 5s.

The distinction of **color** is immediate & **pre-attentive**

You only have to scan for 5s & count them.

This is why **color** is an important visual attribute for a **categorical** variable in graphs

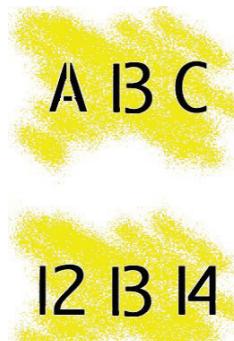

8

Perception: Top-down

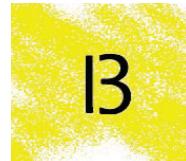

What is in this scene?

What is the middle character?

What here?

An ambiguous figure!

What is the middle letter in each word?

TAE CAT

All of these are demonstrations of the role of **expectations** (top-down) in determining what we “see”
Gregory ('70): perception as **constructive**, depends on prior knowledge

9

1
2

1
2

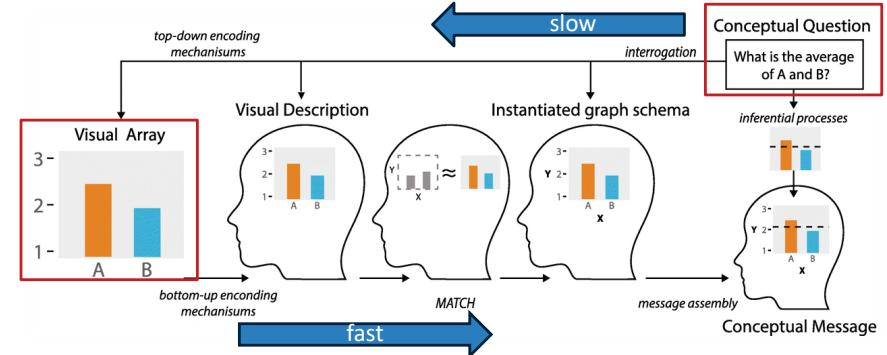

Illusions:
The Eye-Brain
Barrier

Perceptual illusions give some guidance on what **not to do** in data graphics

Cognition: Graph reading

Pinker (1990): cognitive model that integrates top-down and bottom-up encoding mechanisms in understanding of data graphs

- What do we do, given a graph and a question?

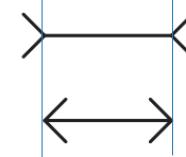

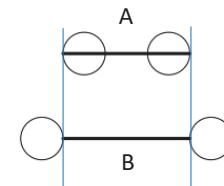

Pinker, S. (1990). A theory of graph comprehension. In *Artificial intelligence and the future of testing*.
Image from: Padilla et al. (2018) <https://bit.ly/4atEwEo>

10

Illusions: Length

Surrounding **context** matters in judging the **length** of objects.

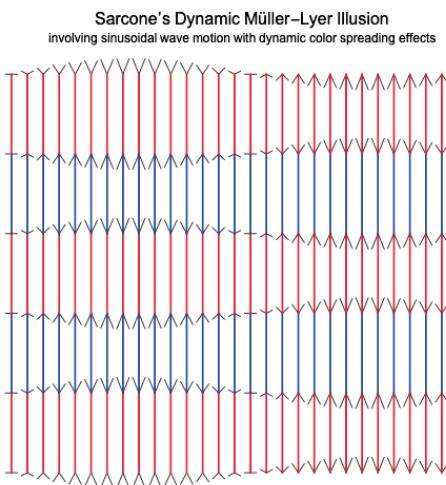

Which **line** is longer? Or are they the same?

Surrounding context pulls perception of length in its direction
This is the famous **Müller-Lyre** illusion

13

Are these lines changing length?

1. Focus your eyes on the center, and describe the pattern
2. Now, focus on **red bar** at top, right. Is it changing?
3. Now, focus on the **gray arrows** surrounding these bars. What do you see?

Arrows are often useful in data graphs.
Always use **same directions & angles** for arrow heads

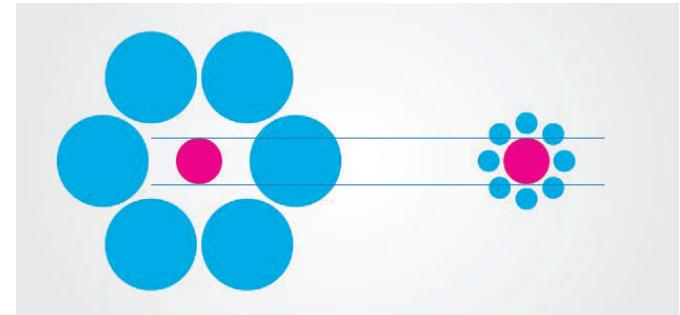

From: <https://medium.com/bouncin-and-behavin-academy/the-optical-trick-that-knocked-my-socks-off-1a72e23ac13f>

14

Illusions: Area

Surrounding **context** matters in judging the **area** of objects.

Which **red circle** is larger? Or are they the same?

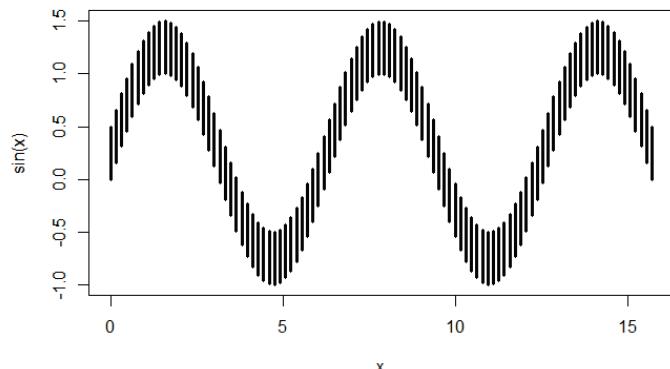

Surrounding **context** pulls perception of area against the background
This is often called the **Ebbinghaus** illusion or the **Tichener** illusion

15

Illusions: Length

Which of the bars are longer? Or, are they all the same length?

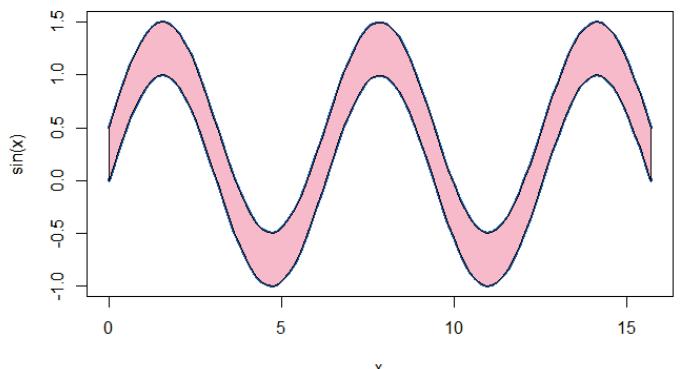

R code:

```
x <- seq(0, 5 * pi, length.out = 100)
w <- 0.5
plot(x, sin(x), ylim = c(-1, 1 + w), type = "n")
segments(x0 = x, y0 = sin(x), y1 = sin(x) + w, lwd = 3)
```

16

Illusions: Difference

Where are **differences** between curves are larger? Or, are they all the same?

This is sometimes called the “sine illusion”

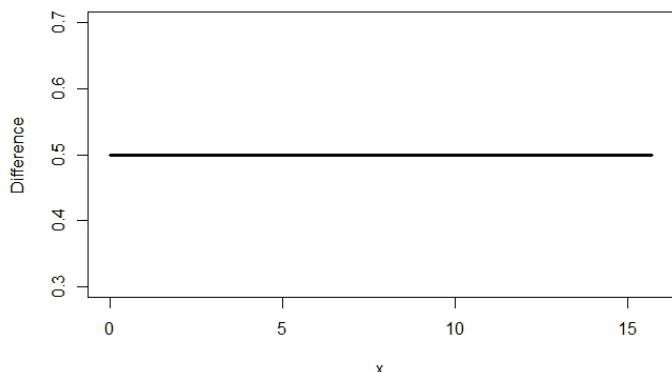

17

Illusions: Difference

Plotting the **difference** directly gives the answer.

OMG!

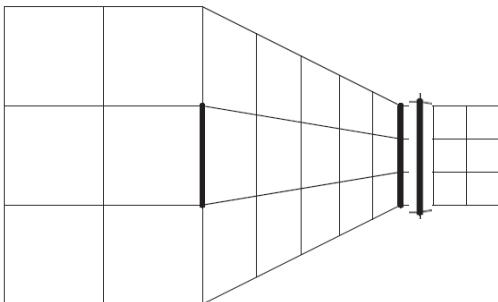

Why does this matter?

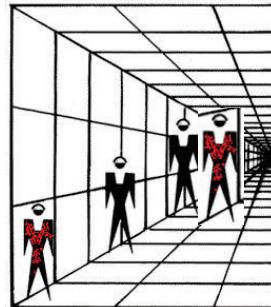

18

Illusions: Perspective

Which **thick** line is longer? Or, both the same?

Which figure is tallest?
Or, all the same?

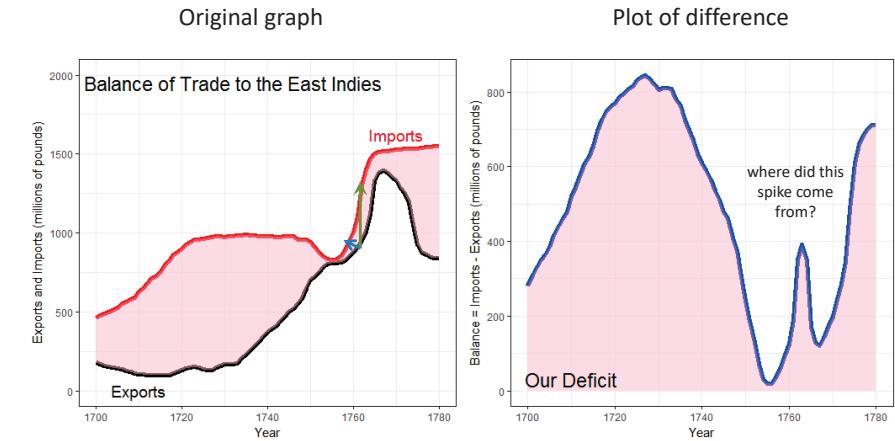

This is often called the **Ponzo** illusion: We judge the **size** of real-world objects relative to their **background** and **perspective**.

20

Distances between curves

Playfair didn't know that judgments of distance between curves are **biased**
We tend to see the **perpendicular** distance rather than the **vertical** distance

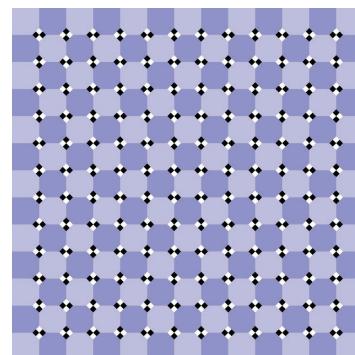

19

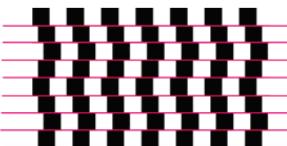

Context illusions: Lines, shapes

Perception of elements of a scene is affected by context, background, etc.

Are the squares straight or tilted?

Are the pink lines straight or curved?

Does the rectangle change in darkness?

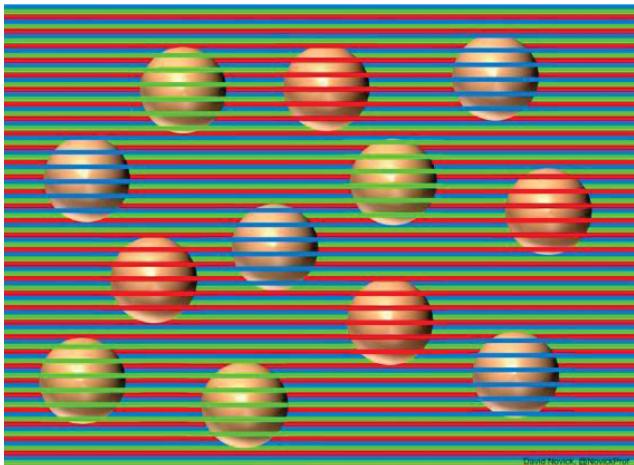

It is hard not to be fooled by these!

21

Context illusions: Color

Are the balls **different colors** or are they all the **same color**?

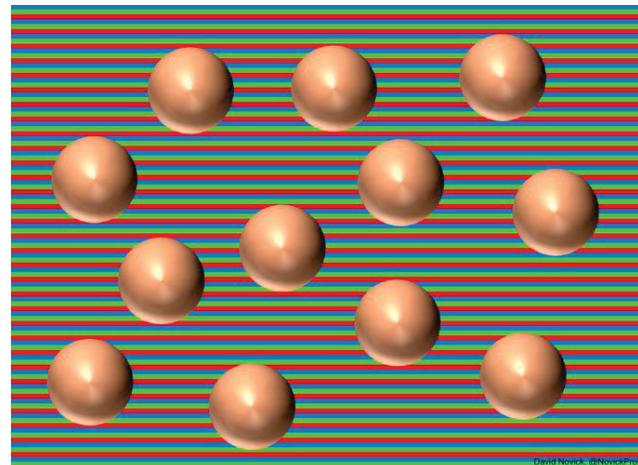

<https://twitter.com/novickprof/status/1139342022551191553>

22

Context illusions: Color

Removing the foreground stripes shows them all the **same** (Munker illusion: perception of color is influenced by neighborhood)

More examples: <http://engineering.utep.edu/novick/colors/>

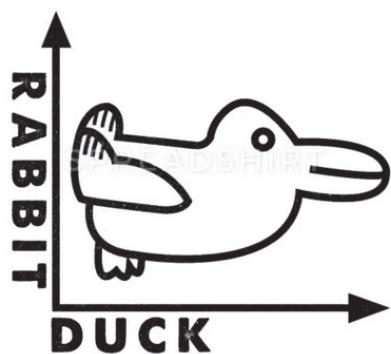

23

Illusions: Semantic/cognitive

Perception of object figures often shows a preference for **orientation** in nature

Is this image a duck, or a rabbit?

Duck or rabbit?

24

Catalog of visual/auditory illusions

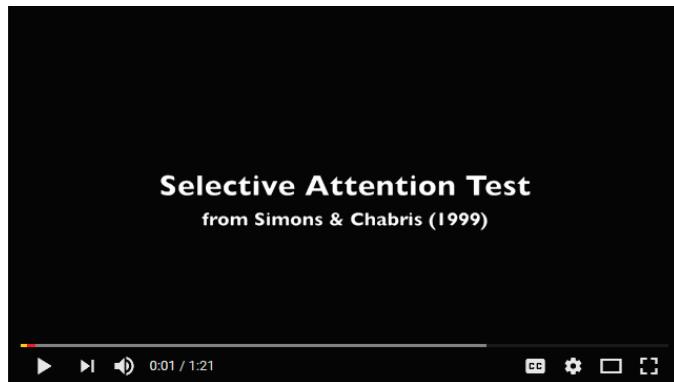

<https://www.illusionsindex.org/illusions>

A large collection of illusions with references to research studies.

A screenshot of the website for "The Illusions Index". The header features the site's logo and navigation links for HOME, ABOUT, EXPLORE, SUGGEST, DONATE, FEEDBACK, and QUIZ. Below the header is a search bar and a dropdown menu for sorting results. A sidebar on the left contains a "Filter by Tags" dropdown and a message stating "Found 63 matching results". The main content area displays several thumbnail images of illusions, each with a title and a brief description. Some visible titles include "YOUNG WOMAN OR OLD WOMAN", "EXPLORE ILLUSIONS", "ADELSON'S CHECKER-SHADOW ILLUSION", "WATERFALL ILLUSION", and "NEGATIVE AFTERIMAGES".

25

Selective attention

<https://www.youtube.com/watch?v=vJG698U2Mvo>

Attention strongly **focused** on some feature(s) **steals** attention from others

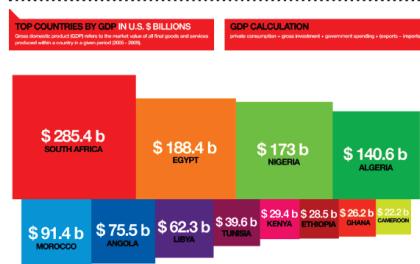

26

Area vs. length judgments

Easy: Which is larger—South Africa or Egypt?

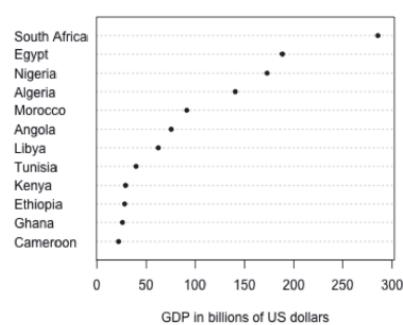

Harder: How much larger is South Africa than Egypt? (% or ratio)

African Countries by GDP

Judgments here based on area

African Countries by GDP

Judgment here based on position along a scale

28

Magnitude estimation

How large are transport accidents?

How much bigger than non-transport accidents?

Estimation of **length** or ratios of length are more accurate than the same judgments of **area**.

27

Theory: Stevens' Power Law

- How does perceived magnitude of a **sensation** relate to stimulus **intensity**?
- S. S. Stevens (1957) showed that, for many domains

$$\text{Sensation} \propto \text{Intensity}^p$$

- These provide ways to assess the **accuracy** of **magnitude estimation** for visual encodings
 - length: most accurate ($p \approx 1$)
 - area, depth: sub-sensitive ($p < 1$)
 - electric shock: hyper-sensitive ($p > 1$)
- But: graph perception is not always a matter of estimating **magnitudes**.

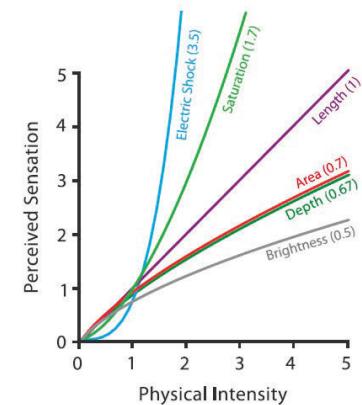

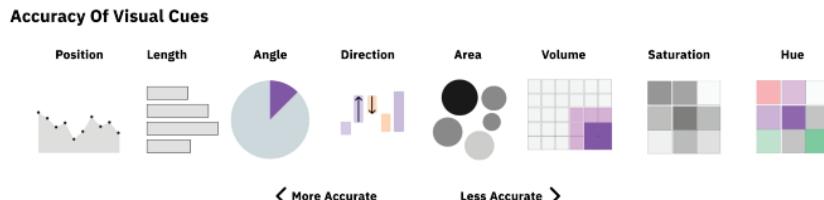

Fig. 5.7 from: Munzner, *Visualization Analysis & Design*

29

Theory→Practice: Scale of accuracy

A commonly used “scale” of accuracy of magnitude judgments of relative size

- How much smaller/larger is A compared to B?

Not necessarily the same for other tasks (Part-whole: What % is A of total?)

30

Encodings: Types & ranks

Based on this, Munzner (2015) proposes a ranking of visual attributes for **ordered** & **categorical** variables in data displays, with different **channels**

These hold when the task is to estimate a **magnitude**.

A different ranking may occur for other graph-based tasks.

angle (pie charts) – good for % of total judgments

color (mosaic plots) – good for pattern perception

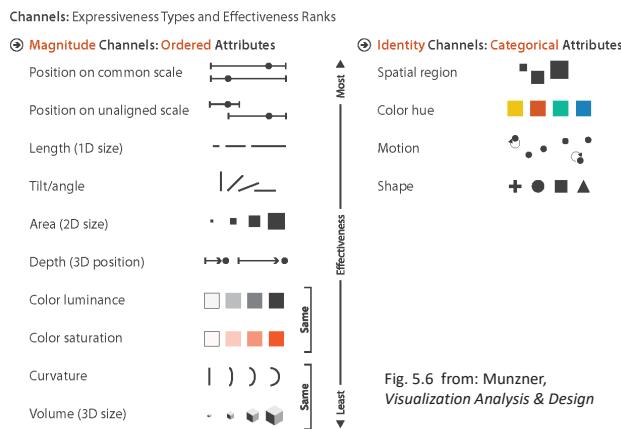

Fig. 5.6 from: Munzner, *Visualization Analysis & Design*

32

Accuracy: Experimental evidence

Cleveland & McGill (1984) and later Heer & Bostock (2010) carried out experiments to assess the relative accuracy of magnitude judgments for different visual encodings

The task here is to estimate the %age of the smaller highlighted portion.

The details of these studies are interesting & important – more next week

The graph of these results is a great model for data display

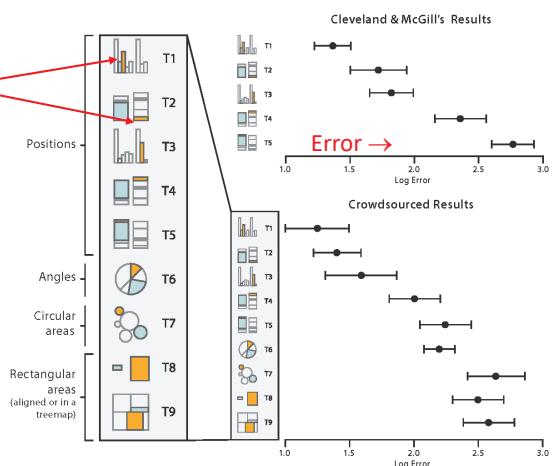

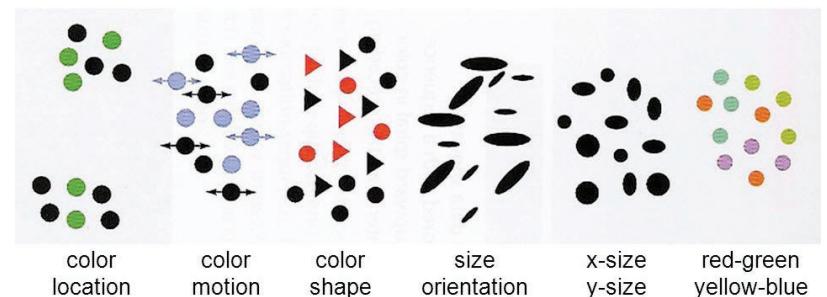

Fig. 5.8 from: Munzner, *Visualization Analysis & Design*

31

Integral & separable encodings

- Some encodings can be viewed **independently**
 - two different variables **can** be decoded separately
- Some **combine** with each other to some degree.
 - different variables **cannot** be easily decoded separately

← Separable

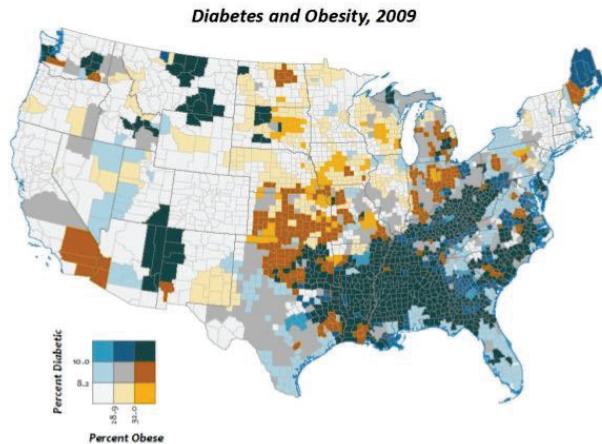

From: Ware, *Information visualization: Perception for Design*

33

Integral dimensions

A bivariate U.S. county-level map showing:

% diabetic (saturation) and % obese (hue)

It is difficult to see variations in **diabetes** separately from **obesity**

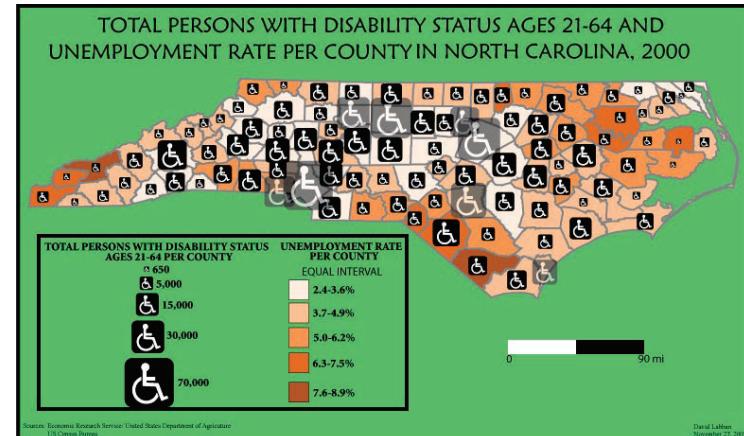

The eye is attracted to the positive correlation between these dark (blue, red) vs. light color

34

Separable dimensions

Bivariate map of N. C.: disability (icon size) and unemployment rate (background saturation)

- These can be seen separately
- (However, total disability is confounded with population density)

35

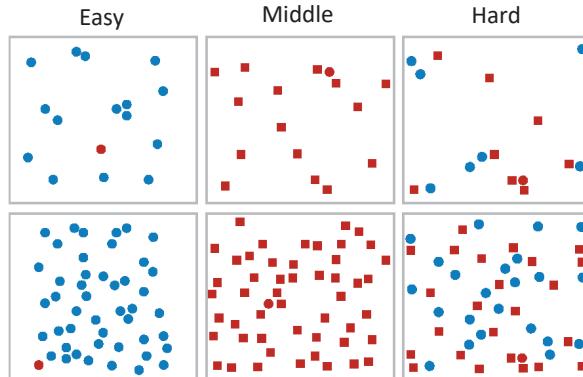

Anomaly detection

Find the red dot ● in each of the following displays

- This task is easiest when all the rest are blue dots ●
- Next easiest when **only shape** distinguishes the red dot ■
- Hardest when both **color and shape** vary ● ■

Sometimes called “popout” effect.
Not a good term.

This is important in designing graphs to **highlight** some points.

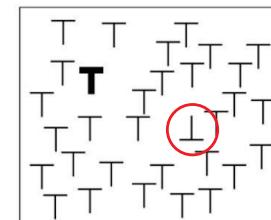

36

Anomaly detection

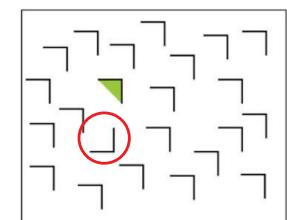

For each display, find the anomaly shown at the left
Color and shape: What is easy or hard depends on the background

⊤
difficult

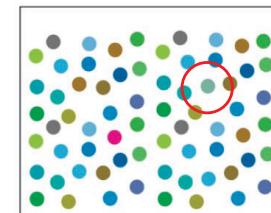

T
easy

⊜
difficult

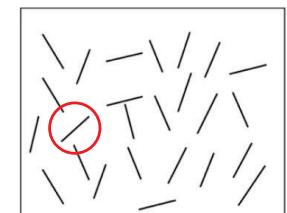

⊜
easy

●
difficult

●
easy

⊐
difficult

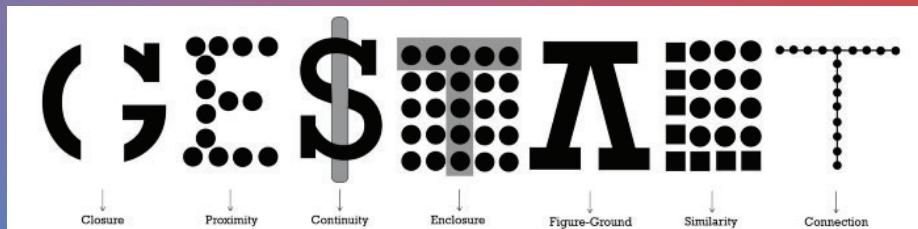

⊐
easy

37

Encodings: Lessons

- Ordered variables
 - Prefer encodings at the top of the hierarchy (position along a scale) to those at the bottom (color saturation, curvature)
- Favor separable encodings
 - Use color and another attribute--- shape, size, orientation ● ■
 - Don't overload symbols--- probably two at most
 - Avoid mixing two aspects of color or two aspects of shape
- Small multiples
 - Reduces the need for multiple encodings within a panel
 - But, makes direct comparison more difficult
- **Highlighting:** to draw attention to one group, use a pre-attentive attribute

38

Gestalt principles of graph perception

40

Encodings: Lessons

- Best to show quantitative variables with **position** or **length**
- Bar charts:
 - Best encoding via length → start at 0
 - Avoid stacked bars (not aligned), where possible
- Dot charts:
 - Best encoding via position along a scale → start at 0
- Frequency data:
 - area/color encoding to show patterns
 - sqrt or log scale often useful to show magnitude
- Color: choose sensibly ordered hues or saturation
- Arrangement
 - make comparisons easier by placing things to be compared nearby

39

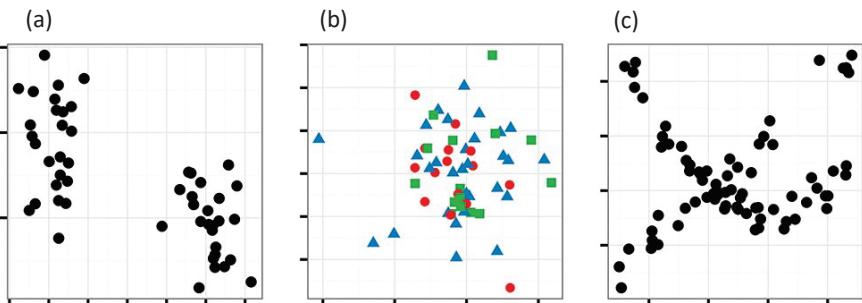

Gestalt principles

- Perception as **top-down** process governed by holistic principles. "Gestalt" = "form"
 - **proximity:** elements close together likely to belong to the same unit
 - **similarity:** more common visual elements increases belonging together
 - **good continuation:** elements that blend together are likely in the same unit
 - **common region:** elements in the same region likely belong together
 - **closure:** elements that make a meaningful whole belong together

41

Gestalt principles

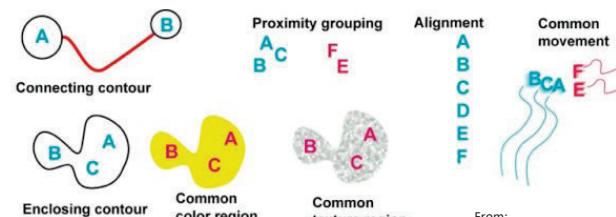

- (a) **proximity** creates impression of 2 groups
- (b) **similarity**: 3 groups via color & shape
- (c) **good continuation** gives impression of 2 groups

42

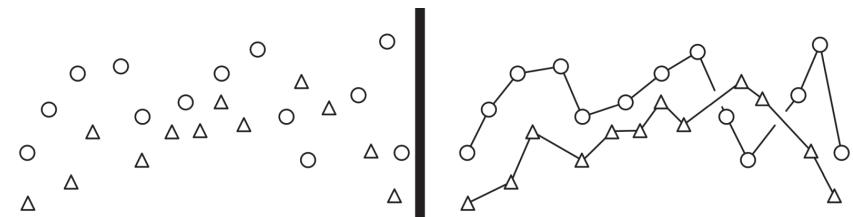

Gestalt principles

More gestalt ideas

From:
<http://blog.yhhu.me/notes/visualizations/cs171.html>

Why lines are good in time series graphs

43

Closure

The Gestalt brain “wants” to make perception simpler by joining up disparate elements into coherent, meaningful wholes

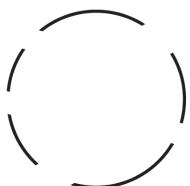

Logos: Empty space or a symbol?

Closure

5 arcs or a circle?

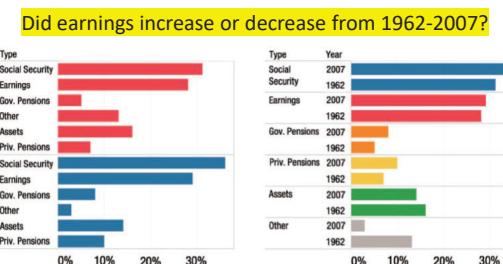

blobs or an animal?

Q: Are these top-down or bottom-up?

Visual grouping & comparisons

Combination of color & proximity grouping → different visual comparisons are easier or harder

What was the most frequent baseball term?
Which terms go together?

From: Franconeri et al (2021) Source DOI: [10.1177/15291006211051956](https://doi.org/10.1177/15291006211051956).

Comparisons in a word cloud:
• weakly controlled by color;

- better controlled by proximity

44

45

Visual grouping & comparisons

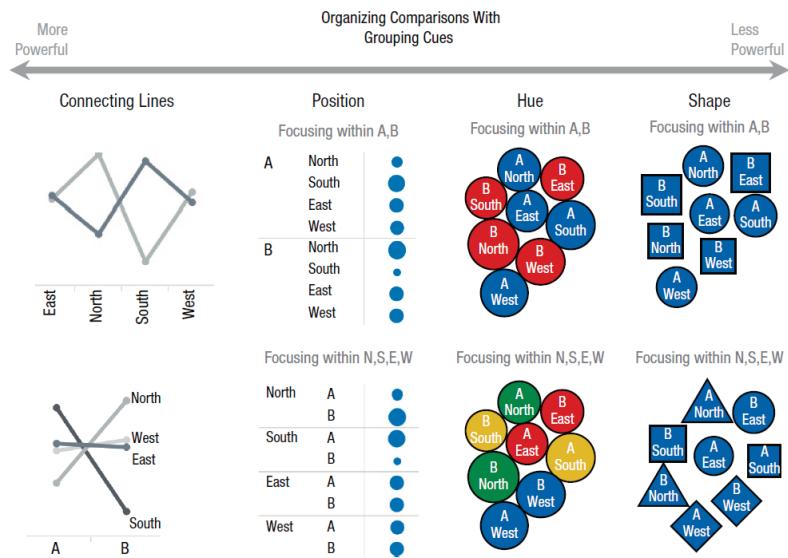

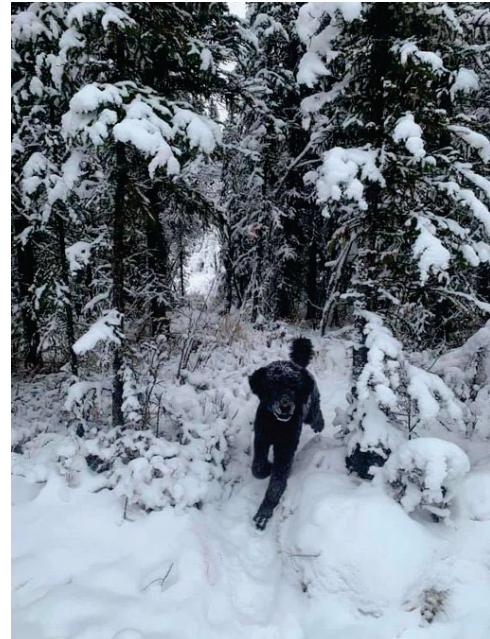

Fig. 8. Several grouping cues that can control how data values are compared. Connecting lines are particularly powerful cues, followed by proximity, color, and shape (Brooks, 2015). 46

Ambiguous figures: Priming

Can you see the **poodle** in this scene?

What about the **man**?

Semantic priming: Suggestion increases likelihood of perception

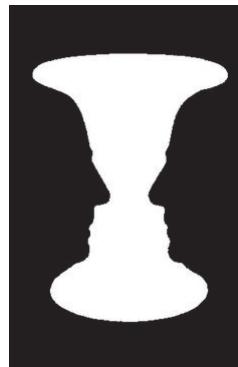

48

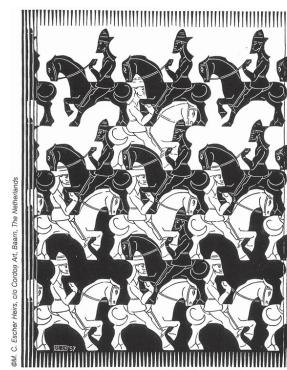

Figure - Ground

What is the figure? What is the background?

Face or vase?

Black or white soldiers?

Face or park?

These examples all use different techniques to create ambiguous figures

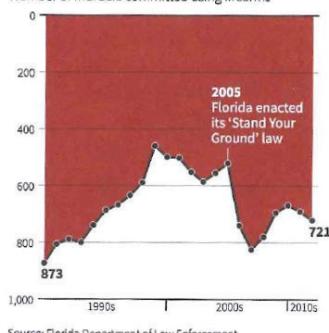

47

Figure - Ground

This graph inverts the y-axis, and shades the area above the curve

Gun deaths in Florida

Number of murders committed using firearms

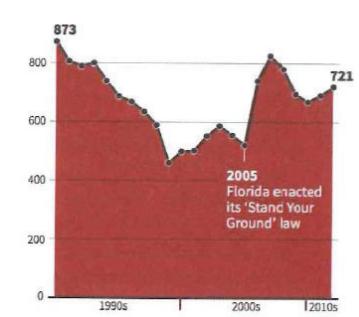

We tend to see 1999 & 2005 as high points

A more conventional version of the same graph

Gun deaths in Florida

Number of murders committed using firearms

Gun deaths increased after the 'Stand your ground' law

48

From: Andy Kirk, *Data Visualization: A Handbook for Data Driven Design*

Discussion

What perceptual features or principles are involved in your reading or understanding of these figures?

or this?

or this?

Top-down?
Bottom-up?
Gestalt?

What about this?

50

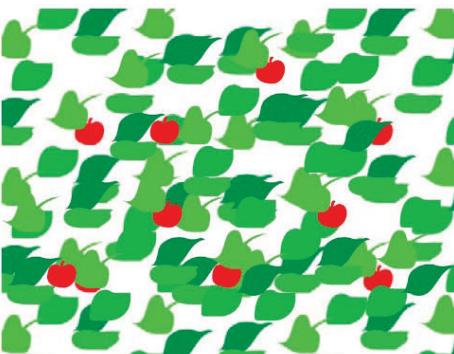

51

Color: Functions in data graphics

Color serves to: **highlight**, **identify**, and **group** elements in a visual display

Find the cherries in this display:

Color acts as a **preattentive** attribute here

From: Colin Ware, *Information Visualization: Perception for Design*

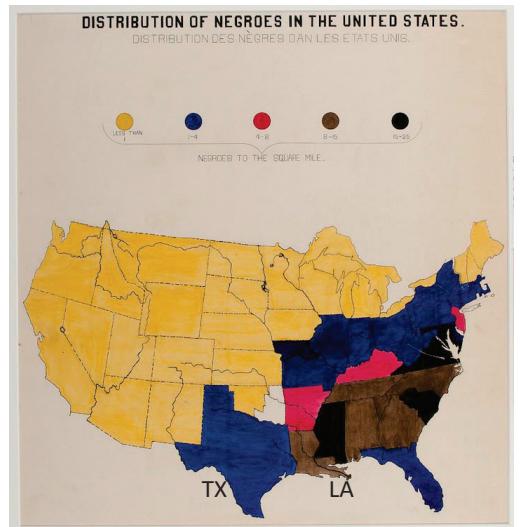

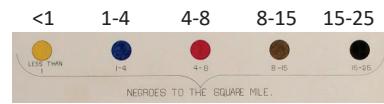

52

Nice graphic, naïve about color

W.E.B. DuBois presented this as part of an exhibition on The American Negro at the 1900 Paris Exposition.

It is a landmark graphic, but shows no understanding of the use of color for a **quantitative** variable.

Q: Are there more Negroes per sq. mile in Texas (TX) or Louisiana (LA)?

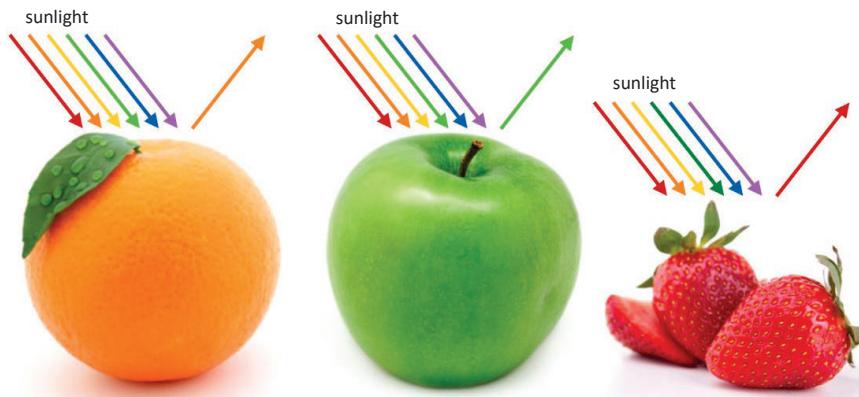

53

Object color

What makes an orange look **orange**, a green apple look **green**, or a strawberry **red**?

Objects absorb colors from the rainbow, but **reflect** their own

From: Miriah Meyer, lecture notes, cs6330, <https://miriah.github.io/teaching/cs6330/>

54

Is this a color photo?

Is this a color photo?

Graphic artist Øyvind Kolås overlaid red, orange, yellow, blue, and green grid lines over a B/W photo.

The colored grid causes us to perceive it as having smooth color

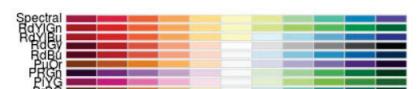

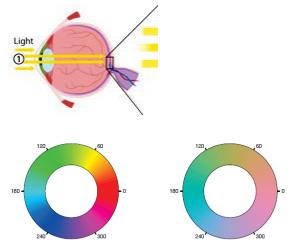

Color perception is influenced by top-down processes of **scene recognition**

<https://petapixel.com/2019/07/31/this-black-and-white-photo-uses-color-grid-lines-to-trick-your-brain/>

56

Color: Aspects in data graphics

- Perception: trichromatic theory
 - How the eye sees **color**
- Color spaces:
 - RGB (additive), CMYK (subtractive)
 - HSV, HCL: perceptually based
- Color palettes for computer graphics
 - ColorBrewer: sequential, diverging, qualitative
 - Color-blind safe ?
 - Photocopy safe ?
- Transparency

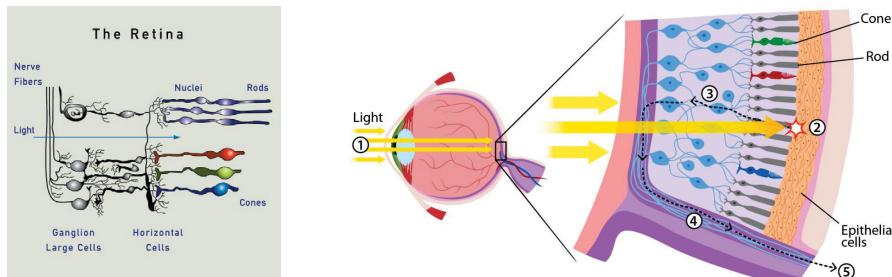

57

Perception: The human eye

- Retina:
 - rods (monochromatic),
 - cones (R, G, B)

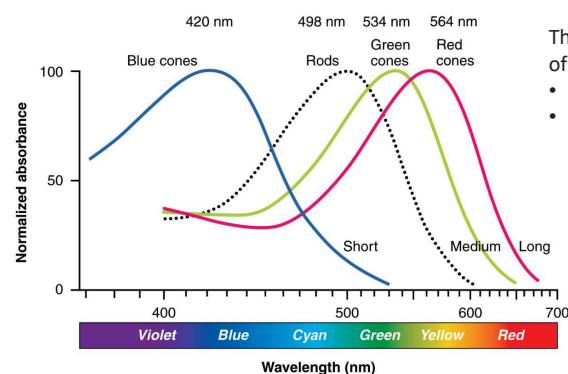

It is of interest to see the wide variety of ways this is conveyed in scientific diagrams:

58

Perception: color sensitivity

- Cells in the retina are differentially sensitive to colors of different wavelength
 - Each have a **distribution** of sensitivity for **short**, **medium** & **long**
 - Their **peaks** are used to name them as **Blue**, **Green**, **Red** or **Rods**

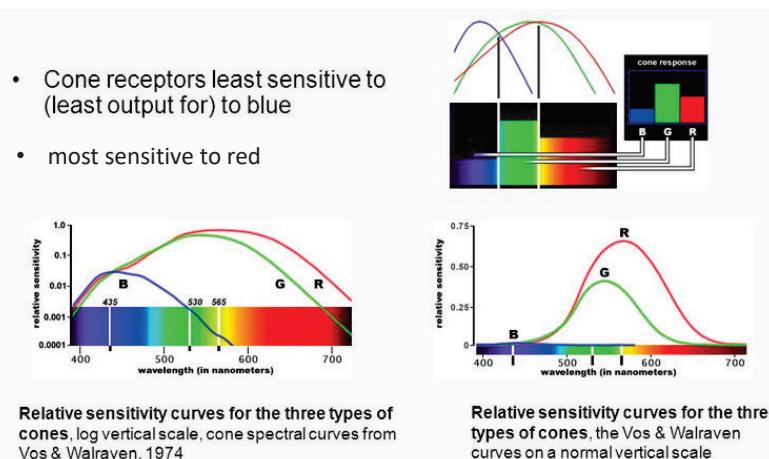

This figure also stimulates questions of scientific visualization

- Rods & cones are “normalized”
- Are they all equal in what we see?

59

Perception: color sensitivity

Color sensitivity, shown on three different scales

from: <http://slideplayer.com/slide/6329532/>

60

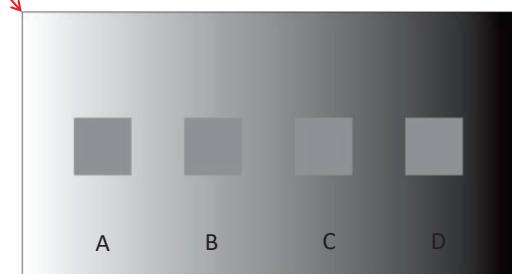

Perception: Contrast

Color perception, even of gray, is influenced by **contrast** against a **background**

Q: Which gray square at right is most similar to that at the left?

A: it is the **same** gray square against a changing background

Most people say **A**, because it is shown on a light background

61

Luminance contrast

Showing blue text on a black background doesn't work very well.
There is insufficient luminance contrast.

Showing blue text on a white background works better.
There is sufficient luminance contrast.

Showing yellow text on a white background doesn't work very well.
There is insufficient luminance contrast.

Showing yellow text on a black background works better.
There is sufficient luminance contrast.

TIP: For presentations, light text on a **dark background** is often preferred.
I don't do this, because I'm also concerned with printing slides.
(With LaTeX Beamer, it is easy to have separate setups for presentation & print)

62

Discovery of color

Feb 8, 1672: Isaac Newton reads his Optics paper to the Royal Society of London
"light is not homogeneous,... but rather consists of rays of different forms"

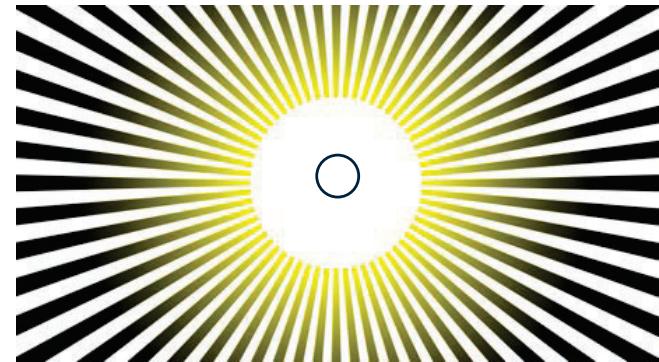

64

Brightness illusion

Is the white at the center the **same** brightness as the white at the edges?
Or, is it **brighter**?

They are the **same**. We interpret the center as a source of light relative to the surrounding bright yellow.

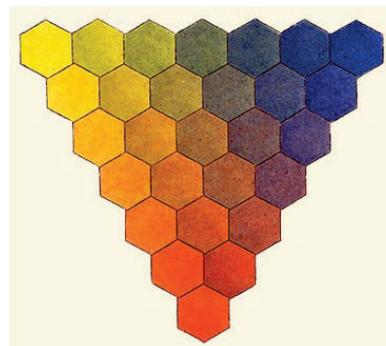

The illusion also affects pupil size! <https://www.pnas.org/content/109/6/2162>

63

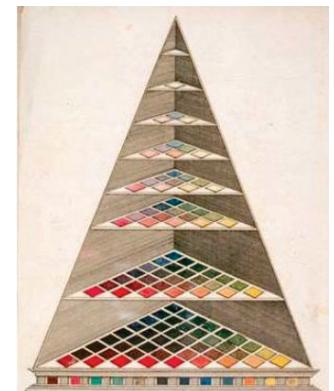

Early color theory

Tobias Mayer (1755) – color theory composed of (**blue**, **red**, **yellow**) as basic colors

Introduces the idea of color "primaries"

Johannes Lambert (1772) – A color pyramid, composed of 7 layers

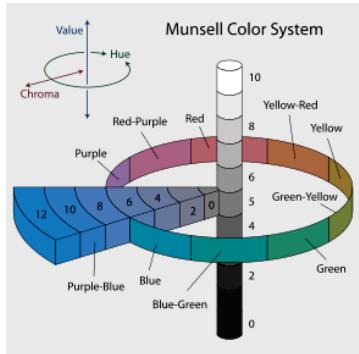

Introduces the idea of color **saturation**

65

Color space: Munsell colors

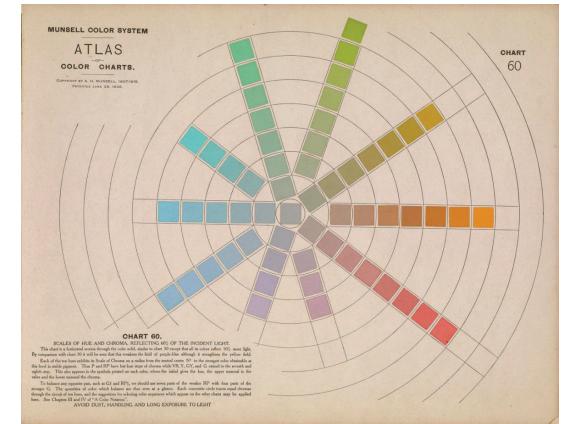

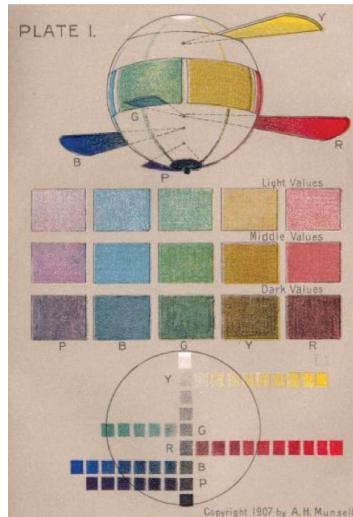

- Color space is 3D
 - How to specify a given color in **perceptual** terms?
 - Albert Munsell (~1930): hue, chroma, lightness (HCL)
 - These form **perceptually uniform & independent** dimensions

By SharkD - CC BY-SA 3.0,
<https://commons.wikimedia.org/w/index.php?curid=8401562> 66

Munsell's color scheme was highly influential in Psychology research
Nearly every lab investigating color used standard sets of Munsell color chips

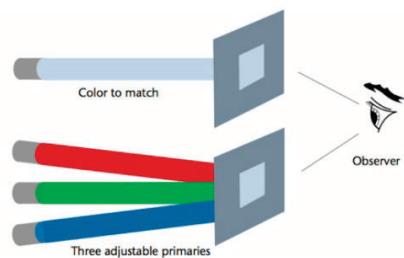

67

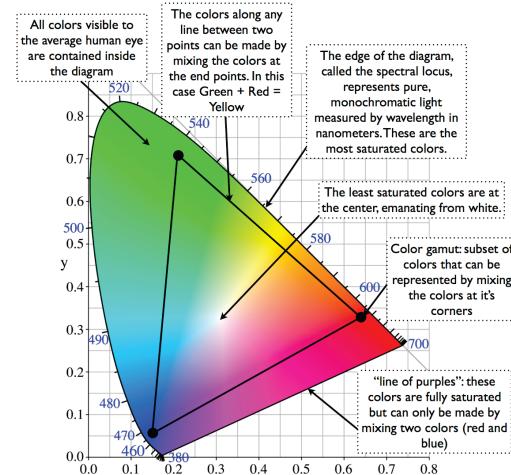

CIE color space

- How do we know about the **perceptual** properties of colors, taking spectral sensitivity into account?

Experiments used a **color-matching** task:

CIE color space

Anatomy of a CIE Chromaticity Diagram

The International Commission on Illumination (CIE) in 1931 defines a color space of (x,y,z) coordinates based on color-matching experiments combining R, G, B light sources in additive mixtures, and a "standard colorimetric observer"

This defines a new color theory connecting **physical** properties and human **perception** (spectral sensitivity).

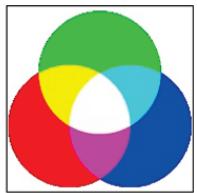

There are eventually a variety of CIE color spaces (CIELab, CIELuv, ...) and lots of formulas for converting among them.

Color space: RGB & CMYK

Enter technology: how to produce color?

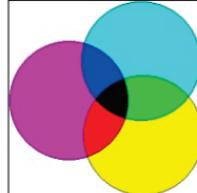

- RGB:
 - Combine light: $R + G + B = \text{white}$
 - Used in computer monitors, TV, film
- CMYK:
 - Combine ink: $\text{Cyan} + \text{Magenta} + \text{Yellow} = \text{Black}$
 - Used in color laser printers, the print industry

Additive colour system

Mixture of primary light colours-
White

Subtractive Colour System

Mixture of primary pigment colours
Black

Caution: R, SAS, SPSS use RGB by default

TIP: for publishing, you may need to convert graphics from RGB to CMYK.

- Some software offer useful tools for this:
- Adobe Acrobat Pro
 - ImageMagik

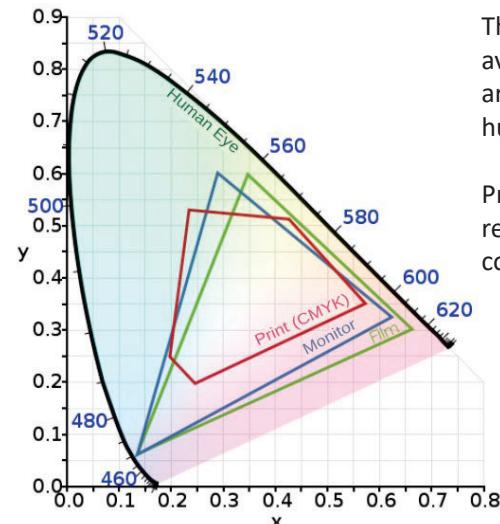

70

Color space: RGB & CMYK

The standard gamut of colors available for different **display media** are a restricted subset of what the human eye can see.

Print (CMYK) is most restricted, and requires a more careful choice of color in graphics

⚠ Always check the display on different media.

71

Color in DataViz Design

There are several commonsense rules & guidelines for use of color in statistical graphics, maps & info vis

RULES

INTUITIVENESS Use intuitive colors. When choosing them, consider what associations do they evoke. If possible, use colors that audience will associate with your data anyway.	CLARITY Use colors to make the data easier to read. Make sure your audience will be able to distinguish between the items shown in the visualization.
<input checked="" type="checkbox"/> LAND <input type="checkbox"/> WATER	<input type="checkbox"/> LAND <input checked="" type="checkbox"/> WATER
MODERATION Use colors in moderation. For a simple dataset, a single color is preferable. Use color as a strategic tool to highlight the important parts of your visual.	CLASSIFICATION Don't use a gradient color palette for categories. And the other way round - different colors for same measurement.
<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

72

From: Alicja Gosiewska, Data Visualization Techniques, <https://bit.ly/3RZWw0t>

Software: Color specification

- Color is often hard to use effectively in software, because the ways to specify it are so varied:
 - Color names:** "black", "red", "green3", "skyblue", "cyan"
 - RGB:** black=(0,0,0); green3=(0, 205, 0), cyan=(0, 255, 255)
 - Hex:** black="#000000"; cyan="#00FFFF"

16 beige	#F5F5DC	245 245 220	65 cyan	#00FFFF	0 255 255
19 bisque	#FFE4C4	255 228 196	66 cyan1	#00FFFF	0 255 255
20 bisque1	#FFE4C4	255 228 196	70 cyan2	#00EEEE	0 238 238
21 bisque2	#EED5B7	228 212 183	71 cyan3	#00CCD9	0 208 205
22 bisque3	#CDCD99	205 193 159	72 cyan4	#008888	0 139 139
23 bisque4	#8B7D6B	139 125 107	73 darkblue	#00008B	0 0 139
24 black	#000000	0 0 0	74 darkcyan	#008888	0 139 139
25 blanchedalmond	#FFEBBC	255 235 205	75 darkgoldenrod	#B8860B	184 134 11
26 blue	#0000FF	0 0 255	76 darkgoldenrod1	#FB90F	255 195 15
27 blue1	#0000FF	0 0 255	77 darkgoldenrod2	#E8A0D0	238 173 14
28 blue2	#0000EE	0 0 238	78 darkgoldenrod3	#CD50C	205 149 12
29 blue3	#0000CD	0 0 205	79 darkgoldenrod4	#B6508	139 101 8
30 blue4	#0000B	0 0 119	80 darkgray	#A9A9A9	169 169 169
31 blueviolet	#8A2BE2	178 42 226	81 darkgreen	#006400	0 100 0
32 brown	#A52A2A	165 42 42	82 darkgrey	#A9A9A9	169 169 169

See: <http://research.stowers.org/mcm/efg/R/Color/Chart/> for R color charts

73

Software: Color specification

WTF! Give me a break, please:

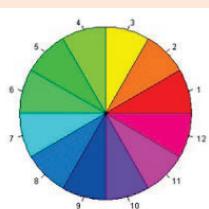

- Make it easier to **compute** with colors: define blends of colors or a color ramp
- Make it easier to specify color **schemes** with decent **perceptual** properties
- Make it easier to map colors to **data features** I want to show

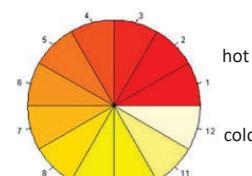

74

R: basic palettes

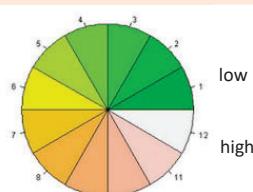

`n < 12
pie(rep(1, n), col=rainbow(n))`

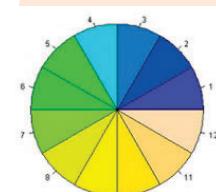

`pie(rep(1, n), col=heat.colors(n))`

`pie(rep(1, n), col=terrain.colors(n))`

`pie(rep(1, n), col=topo.colors(n))`

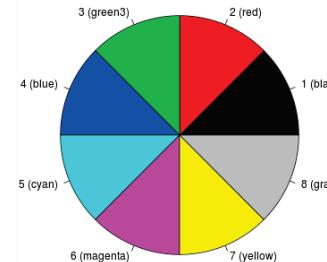

76

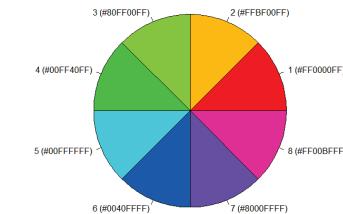

Software: palettes

- R (and other software) provide palettes of colors used for **defaults** in graphs
 - Not all are nice— depends on your purpose
 - But, there are lot of choices – maybe too many!
 - You can change them **once** for all graphs in a session or paper

```
> (pal <- palette())  
[1] "black" "red" "green3" "blue" "cyan" "magenta" "yellow" "gray"  
> pie(rep(1, length(pal)), labels = sprintf("%d (%s)", seq_along(pal), pal), col = pal)
```

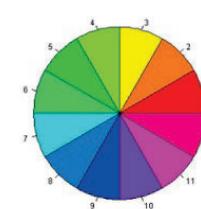

`palette(rainbow(8)); pie(...)`

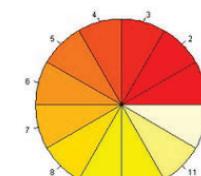

75

R: basic palettes

`rainbow`

`heat`

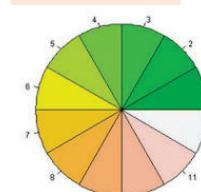

Discussion Q:

- Which of these seem better for **quantitative** variables?
- Which for **categorical**?

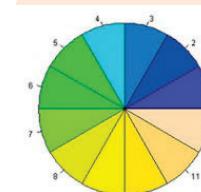

These are shown for **area fill**. How effective would they be for:

- **point** colors
- **line** colors

`terrain`

`topo`

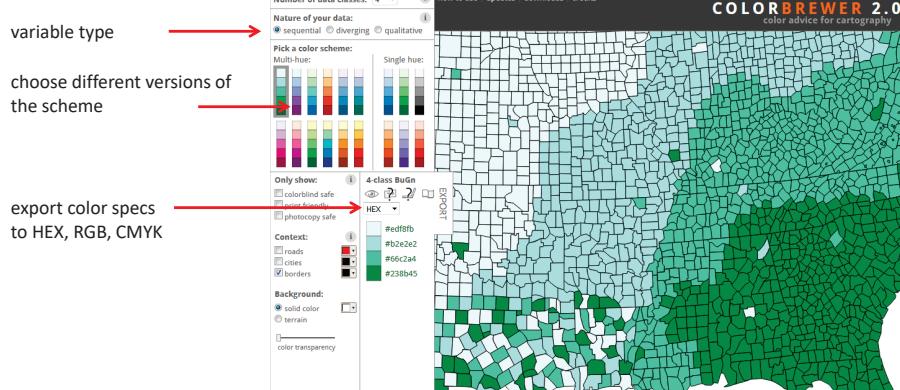

E.g., **yellow** is bright as an area, but nearly invisible as points (•) or lines (→) or text on a white background

77

palettes: ColorBrewer

ColorBrewer, by Cynthia Brewer provides an interactive application for choosing color palettes, <http://colorbrewer2.org>

This is one example of a **multi-hue** scheme for a **quantitative, sequential** variable, shown from low to high with 4 color classes

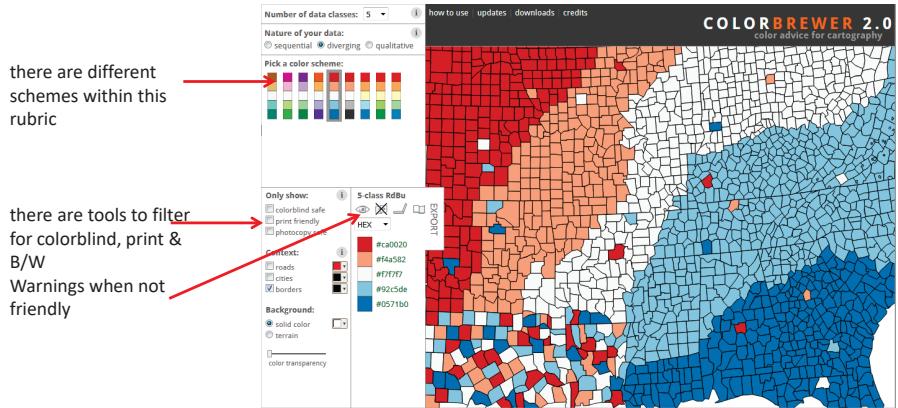

This example: <http://colorbrewer2.org/#type=sequential&scheme=BuGn&n=4>

78

palettes: ColorBrewer

Diverging schemes are designed to show a quantitative variable, where we want to see what is low vs. what is high, leaving the middle of less visual impact – difference from average, residuals, ...

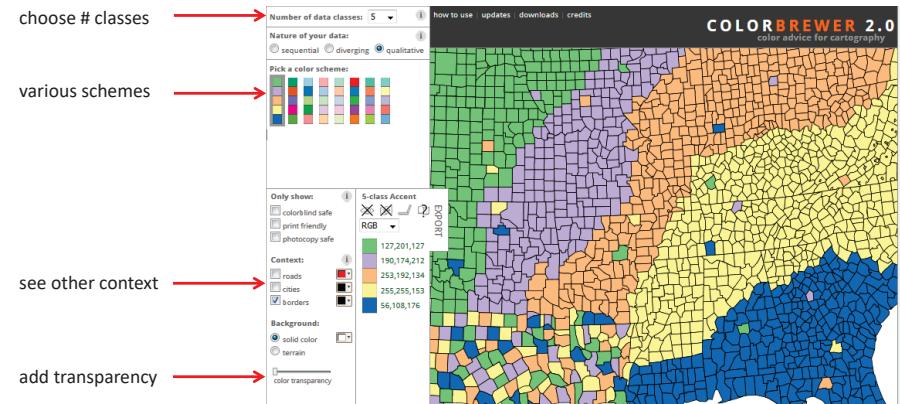

This example: <http://colorbrewer2.org/#type=diverging&scheme=RdBu&n=5>

79

palettes: ColorBrewer

Qualitative schemes are designed to show a **categorical** variable, where we want to see differences among **unordered** categories

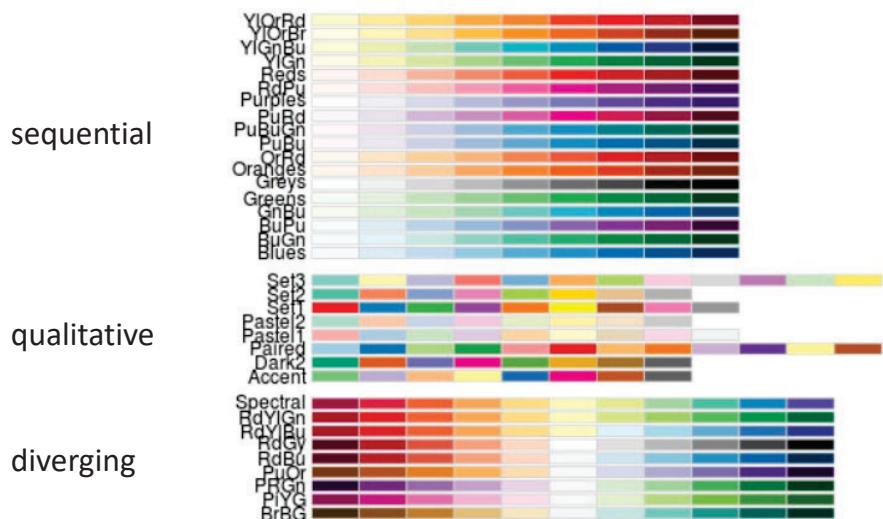

These are all available in the RColorBrewer package

This example: <http://colorbrewer2.org/#type=qualitative&scheme=Accent&n=5>

80

palettes: RColorBrewer

RColorBrewer::display.brewer.all()

81

R: choose_palette()

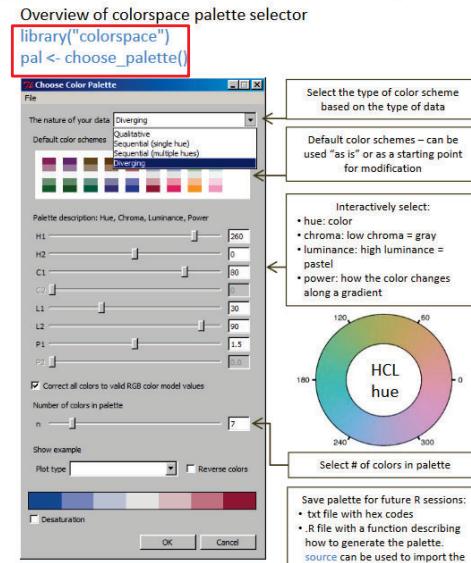

The colorspace package in R has an interactive palette widget.

It also provides functions for many kinds of color manipulations.

The R Color cheatsheet, by Malcolm Fraser is a goto source for all aspects of color in R:

<https://www.nceas.ucsb.edu/~frazier/RSpatialGuides/colorPaletteCheatsheet.pdf>

R color cheatsheet

82

Viridis palettes

Designed by Stéfan van der Walt and Nathaniel Smith for Python; ported to R in the [viridis](#) package.

Goals:

- **Colorful**, spanning as wide a palette as possible so as to make differences easy to see
- **Perceptually uniform**: values close to each other have similar-appearing colors and values far away from each other have more different-appearing colors
- **Robust to colorblindness**: these properties hold true for people with common forms of colorblindness, as well as in grey scale printing
- **Pretty**: much nicer as a defaults in software

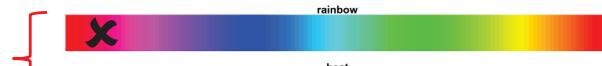

These assertions are largely **untested**. Perhaps a good research topic!

83

Comparing quantitative palettes

For a **quantitative** variable and a **continuous** color scale, there are many choices.
How well do they work?

R base palettes

ggplot default palette

ColorBrewer palettes

viridis palettes

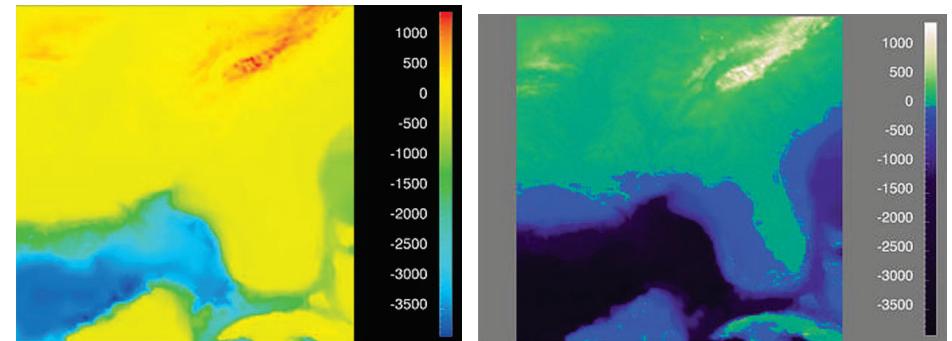

This is a bit tricky: ideally, we want a **wide range** of color

84

Comparing palettes

What is shown in this map?

Now we can see it—elevation in the Florida coast: above or below 0

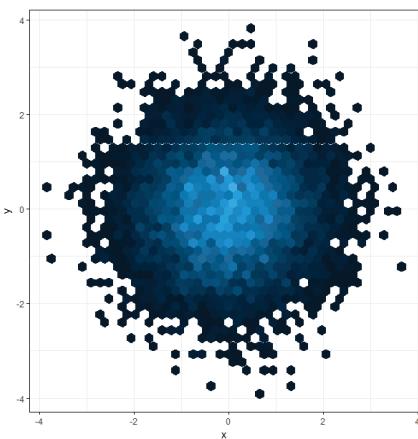

The rainbow color scale obscures the main features

This color scheme was designed to reveal the essential topography of the map & to have perceptually equal elevation steps

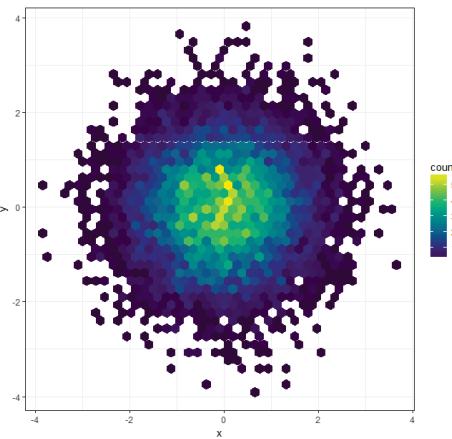

Comparing palettes

ggplot default palette

```
df <- data.frame(x = rnorm(10000), y = rnorm(10000))
g <- ggplot(df, aes(x = x, y = y)) +
  geom_hex(bins=40) + coord_fixed() + theme_bw()
g
```

viridis default palette

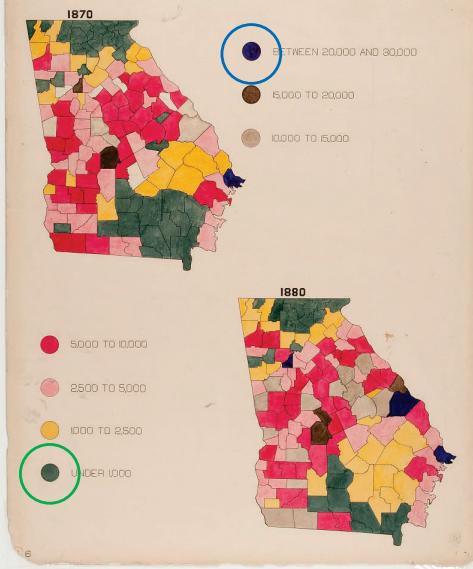

```
library(viridis)
g + scale_fill_viridis()
```

86

WEB Du Bois' sense of color

NEGRO POPULATION OF GEORGIA BY COUNTIES.

Goal: Show Negro population of counties in Georgia from 1870 to 1880 & change

Which counties had largest Negro pop?

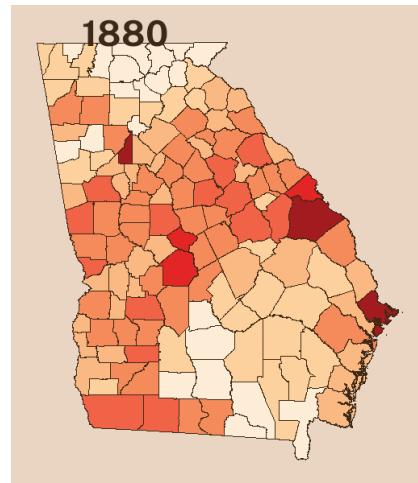

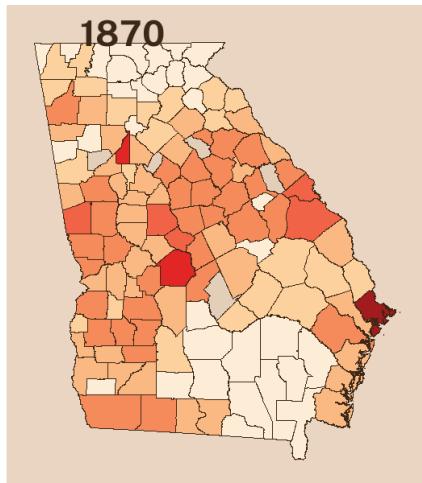

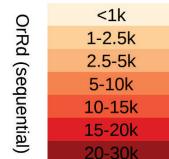

Which had lowest?

Where was the change greatest?
(HARD: need to plot the difference)

87

RColorBrewer to the rescue

```
library(RColorBrewer)
colors <- brewer.pal(n = 7, name = "OrRd")
colors <- c("#Fef0d9", "#Fdd49e", "#fdbb84", "#fc8d59",
          "#ef6548", "#d7301f", "#990000")
```

88

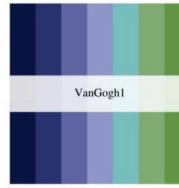

Metbrewer palettes

Artistic palettes inspired by works at the Metropolitan Museum of Art in New York

Renoir

Nini in the Garden

Cypresses, 1889, Vincent van Gogh

Cap Nègre, 1909, Henri-Edmond Cross

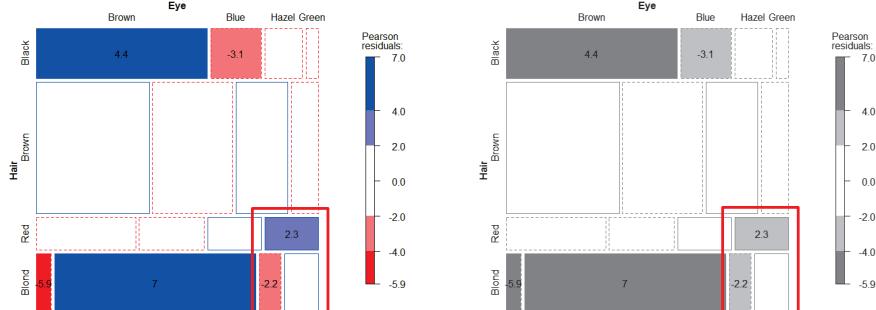

89

Color → B/W ?

Graphics designed in color often must consider what happens when graphs are reproduced in B/W: grayscale

- This is particularly hard for a **diverging** color scale
- My original design for mosaic plots used solid vs. dashed lines to distinguish + vs. -

`mosaic(haireye, labeling=labeling_residuals, gp=shading_Friendly)`

90

Color → B/W ?

The design of this graphic table was crafted to preserve readability if printed in B/W.
NB: text for numbers changes from black to white depending on background color.

Figure 9: Section 37 benefits by type (1998–2015)

	1998–2002	2003–2005	2006–2009	2010–2013	2014–2016	Scale
Roads, streetscapes	30	35	54	83	15	0 - 10
Culture, community, recreation	26	50	59	47	16	11 - 20
Parks	27	41	41	52	20	21 - 30
Affordable housing	17	26	38	56	11	31 - 40
Public art	26	25	41	32	4	41 - 50
Heritage	16	13	26	18	3	51 - 60
Transit	11	7	10	20	3	61 - 70
Libraries	6	2	5	11	1	71 - 80
Other	3	6	7	8	3	81 - 90

Background shading works equally well in color or B/W
A+ for visual design!

91

Colorblindness

Most common forms are genetic, and involve a deficiency in one of the cone type sensitivities

- Protnopia (red deficient)
- Deutanopia (green deficient)
- Tritanopia (blue deficient)

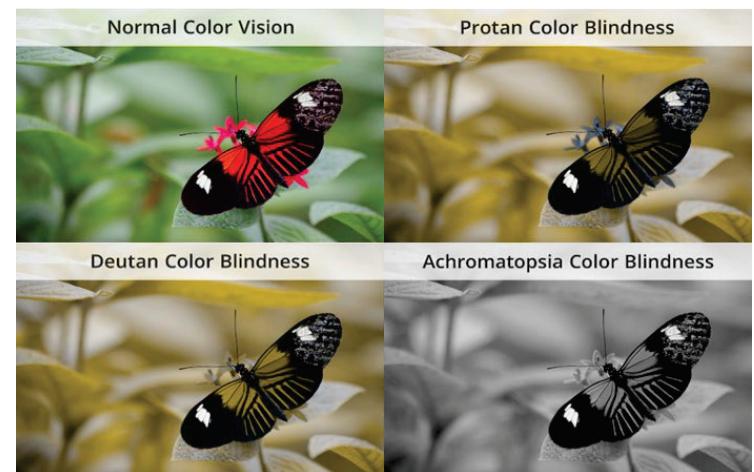

Some form of red-green insensitivity is most common

- about 6-8% of population
- more common in males

TIP: Avoid color scales with main variation between red & green

Colorblindness

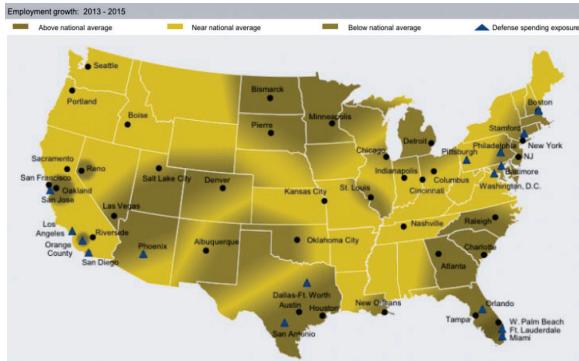

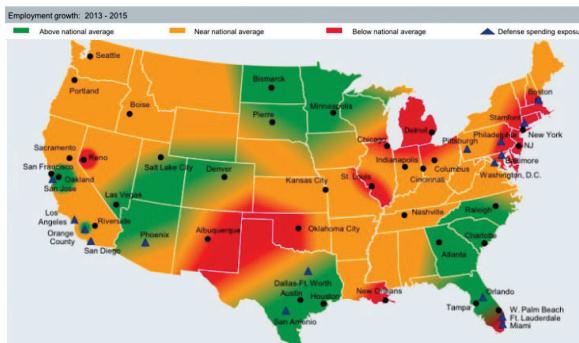

What an image looks like with various forms of color deficiency

Red-green colorblindness: -R (protan) ≈ -G (deutan)

92

93

Goal: Show employment growth, 2013—2015

Original design, using
 • green: above average
 • red: below average

How this looks to
someone with red-green
colorblindness

red & green become
indistinguishable

95

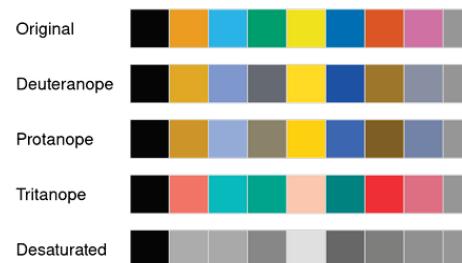

colorspace: palette visualization

swatchplot(): display collections of palettes in flexible ways

Effect of varying hue, chroma and luminance individually

```
swatchplot(
  "Hue" = sequential_hcl(5, h = c(0, 300), c = c(60, 60), l = 65),
  "Chroma" = sequential_hcl(5, h = 0, c = c(100, 0), l = 65, rev = TRUE, power = 1),
  "Luminance" = sequential_hcl(5, h = 260, c = c(25, 25), l = c(25, 90), rev = TRUE, power = 1),
  off = 0
)
```

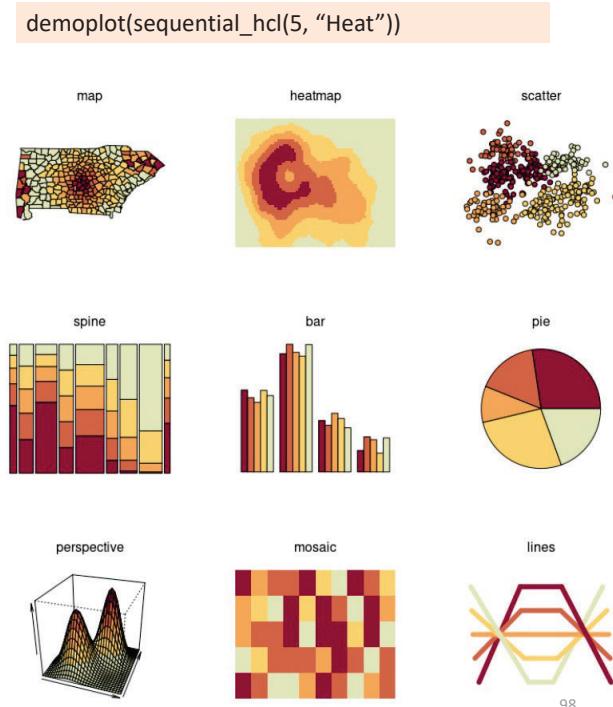

Emulate different types of color vision deficiency for one or more palettes

swatchplot(palette.colors(), cvd = TRUE)

97

colorspace: demoplot()

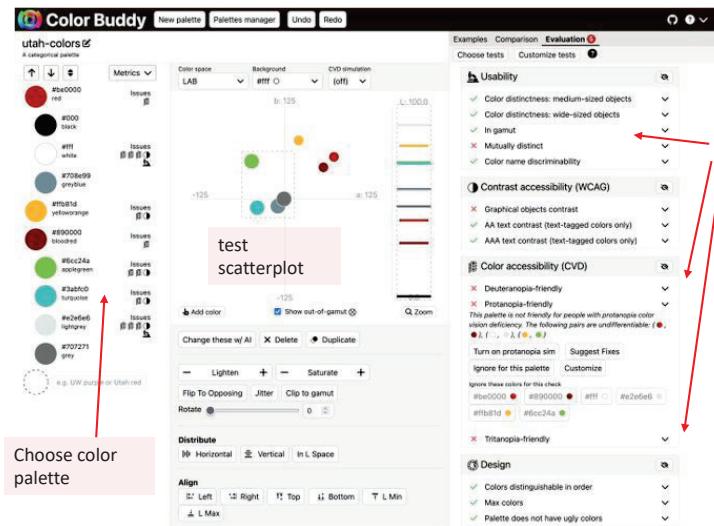

See how color palettes
work in different kinds
of statistical displays

demoplot(sequential_hcl(5, "Heat"))

99

Color: Lessons

- Use colors to represent differences in meaning
 - Avoid **gratuitous use of multiple colors**
 - Use consistent color scheme across multiple graphs of the same data (set your `palette()`)
- Consider presentation goal:
 - **Highlight** one subset against the rest?
 - Group a categorical variable
 - Encode a quantitative variable
- Consider differences in color perception, B/W printing

Color: Lessons

- Consider encoding scheme:
 - **Categorical:** Use a wide range of hues, of ~ same saturation
 - **Sequential:** use a small range of hues of varying intensity
 - **Diverging:** Use two sequential schemes, decreasing toward the middle

Transparency

Colors can be made partially **transparent**, by adding an “alpha” channel,
 $0 \leq \alpha \leq 1$ (opaque)

Filled areas combine to look more saturated
What do you see here?

This also works well with filled point symbols, which would otherwise be obscured when they overlap

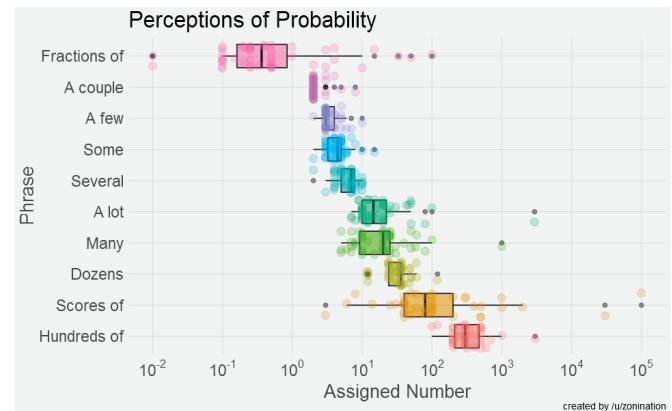

Different colors “blend”
What do you see here?

Transparency: Adding another layer

Transparency also works well to combine different graphical features in a plot
Here, a filled boxplot and dots representing individual observations

What number would you assign to the following phrases?

From: <https://github.com/zonation/perceptions>

103

Summary

- In designing data graphics, consider the viewer
 - Info → encoding → image → decoding → understanding
- Perception: much is known, with ~ links to graphics
 - ↑ Bottom up: perceptual features, what grabs attention
 - ↓ Top down: expectations provide a context
 - ☺ Encoding attributes must consider what is to be seen
- Color: What is the presentation goal?
 - Color palettes for different purposes
 - Transparency increases the effective use of color
